U.S. Patent and Trademark Offic PTOL-326 (Rev. 1-04) Application/Control Number: 10/082,682

Art Unit: 2613

DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Loyd, in view of Honda and Steinberg.
 - Claims 1, 8: A method of providing remote wireless video surveillance of a location comprising the steps of:

using a miniature analog video camera to generate analog electrical signals representative of an image of the location; (See Loyd figure 5 item 510.) converting the analog signals to digital electrical signals and packetizing the digital electrical signals into an IP format; (See Honda figure 7 item 100 and 702, and column 11 line 61, the Ethernet standard requires packetizing the data in an IP format.) transmitting the video data in IP format over a twisted wire pair using a first ethernet transceiver; (See Honda figure 7 item 702 and 703 as well as column 11 line 61 ethernet wire is a twisted pair wire) receiving the video data in IP format over the twisted wire pair using a second ethernet transceiver; (See figure 13 items 1301 and 1302 as well as Loyd figure 5 item 512) wirelessly transmitting a microwave signal containing the IP format data to a base unit; (See Loyd figure 5 item 512 as well as column 5 lines 42-44.

at the base unit, receiving the IP format data microwave signal from the remote unit; (See Loyd Figure 5 item 520 as well as Steinberg figure 5 item 42)

Art Unit: 2613

sending the IP format data over a computer network to a user terminal; (See Steinberg figure 5 item 141)

converting the IP format data to digital video signals using a video player; See Honda figure 13 item 1000 and

displaying the digital video signals on a monitor at the user terminal. (See Honda figure 13 item 1303 as well as Loyd figure 5 item 522)

At the time the invention was made the use of various communication methods was well known in the art and widely used. While none of the cited references discloses the entire invention as claimed. It would have been obvious to one of ordinary skill in the art to modify Loyd's invention in the following manner. In column 11 lines 1-15 Loyd teaches that the camera could be physically separated from the rest of the electronics. To do this he teaches that a connection would be necessary. Honda teaches the use of an Ethernet connection in figure 7, a person of ordinary skill in the art would have found it obvious to place Honda's item 100 and 702 between Loyd's camera and image transmitter in figure 5 in order to accomplish the connection. Loyd then transmits the wireless signal using a microwave transmitter as cited above. On the receiving end Loyd teaches the use of a wireless receiver item 520 figure 5 as does Stienberg in figure 5. However, while Loyd does not explicitly teach sending the signal over a network he does make mention of the fact that a matrix of surveillance systems could be viewed from a central location thus implying the use of a network and motivating one of ordinary skill in the art to use one See column 10 lines 48-50. Thus it would have been obvious to one of ordinary skill in the art to transmit the video over a network as Steinberg does in item 141 figure 5. Then since the video is still packetized and coded it must be decoded and opened for viewing on the monitor, thus it would have been obvious to use Hondas item 1000 to do so)

Claim 2. The method of claim 1 wherein the IP format comprises TCPIP. (TCP IP is a standard Protocol that has been in use long before the current invention was made. Furthermore

Art Unit: 2613

anytime data is transmitted via the internet the TCP IP protocol is used. Therefore it would have been obvious to use said standard in order to effectively communicate across the network) Official notice served

- Claim 3. The method of claim 1 wherein the microwave transmission has a frequency between 5.0 and 6.0 Ghz. (While Loyd discloses a frequency lower than that claimed, he does mention that any frequency could be used See column 5 lines 42-50. Therefore it would have been obvious to one of ordinary skill in the art to use the claimed range in order to transmit more data in a shorter period of time.)
- Claim 4, 10. The method of claim 1 further comprising the step of inputting pan, tilt, and zoom control instructions at the base unit to control the operation of the camera. (See column 5 the table lists all of the control functions.
- Claim 5. The method of claim 1 further comprising the step of using additional cameras at the location and selecting between video data generated by the cameras. (See Loyd column 10 lines 48-50 as well as Steinberg figure 13.)
- Claim 6. The method of claim 5 wherein the selecting between video data is made by inputs to the base unit. (See Steinberg figure 13 item 226)
- Claim 7. The method of claim 1 wherein the computer network is the Internet. (Use of the internet was well known in the art at the time the invention was made and is an obvious variation which would allow many people to access the system.)
- Claim 9. The system of claim 8 further comprising means for storing video data at the remote unit.

 (See Loyd figure 5 item 528)

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Charles E Parsons whose telephone number is 703-305-3862. The examiner can normally be reached on M-TH 7AM to 5 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Chris Kelley can be reached on 703-305-4856. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
